# Subject Syllabus

<b>B. TECH. SECOND YEAR ( 3<sup>rd</sup> Semester))-CSE/IT/CS/M.Tech. Integrated/Data Science/AI/AI-ML/IoT</b>			
<b>Course code</b>		<b>L T P</b>	<b>Credits</b>
<b>Course title</b>	<b>DISCRETE STRUCTURES</b>	<b>3 0 0</b>	<b>3</b>
<b>Course objective:</b>  The subject enhances one's ability to develop logical thinking and ability to problem solving. The objective of discrete structure is to enables students to formulate problems precisely, solve the problems, apply formal proofs techniques and explain their reasoning clearly.			
<b>Pre-requisites:</b>  1. Basic Understanding of mathematics 2. Basic knowledge algebra. 3. Basic knowledge of mathematical notations			

# Subject Syllabus

Course Contents / Syllabus		
Unit 1	Set Theory, Relation, Function	8 Hours
<p><b>Set Theory:</b> Introduction to Sets and Elements, Types of sets, Venn Diagrams, Set Operations, Multisets, Ordered pairs. Proofs of some general Identities on sets.</p> <p><b>Relations:</b> Definition, Operations on relations, Pictorial Representatives of Relations, Properties of relations, Composite Relations, Recursive definition of relation, Order of relations.</p> <p><b>Functions:</b> Definition, Classification of functions, Operations on functions, Growth of Functions.</p> <p><b>Combinatorics:</b> Introduction, basic counting Techniques, Pigeonhole Principle.</p> <p><b>Recurrence Relation &amp; Generating function:</b> Recursive definition of functions, Recursive Algorithms, Method of solving Recurrences.</p> <p><b>Proof techniques:</b> Mathematical Induction, Proof by Contradiction, Proof by Cases, Direct Proof.</p>		
Unit 2	Algebraic Structures	8 Hours
<p><b>Algebraic Structures:</b> Definition, Operation, Groups, Subgroups and order, Cyclic Groups, Cosets, Lagrange's theorem, Normal Subgroups, Permutation and Symmetric Groups, Group Homomorphisms, Rings, Internal Domains, and Fields.</p>		

# Subject Syllabus

<b>Unit 3</b>	<b>Lattices and Boolean Algebra</b>	<b>8 Hours</b>
<p>Ordered set, Posets, Hasse Diagram of partially ordered set, Lattices: Introduction, Isomorphic Ordered set, Well ordered set, Properties of Lattices, Bounded and Complemented Lattices, Distributive Lattices.</p> <p><b>Boolean Algebra:</b> Introduction, Axioms and Theorems of Boolean Algebra, Algebraic Manipulation of Boolean Expressions, Simplification of Boolean Functions.</p>		
<b>Unit 4</b>	<b>Propositional Logic</b>	<b>8 Hours</b>
<p><b>Propositional Logic:</b> Introduction, Propositions and Compound Statements, Basic Logical Operations, Well-formed formula, Truth Tables, Tautology, Satisfiability, Contradiction, Algebra of Proposition, Theory of Inference.</p> <p><b>Predicate Logic:</b> First order predicate, Well-formed formula of Predicate, Quantifiers, Inference Theory of Predicate Logic.</p>		

# Subject Syllabus

Unit 5	Tree and Graph	8 Hours
<p><b>Trees:</b> Definition, Binary tree, Complete and Extended Binary Trees, Binary Tree Traversal, Binary Search Tree.</p> <p><b>Graphs:</b> Definition and terminology, Representation of Graphs, Various types of Graphs, Connectivity, Isomorphism and Homeomorphism of Graphs, Euler and Hamiltonian Paths, Graph Coloring</p>		
<p><b>Course outcome:</b> After completion of this course students will be able to:</p>		
Unit 1	Apply the basic principles of sets, relations & functions and mathematical induction in computer science & engineering related problems.	K3
Unit 2	Understand the algebraic structures and its properties to solve complex problems.	K2
Unit 3	Describe lattices and its types and apply Boolean algebra to simplify digital circuit.	K2, K3
Unit 4	Infer the validity of statements and construct proofs using predicate logic formulas.	K3, K5
Unit 5	Design and use the non-linear data structure like tree and graphs to solve real world problems.	K3, K6

# Branch wise Application

1. Discrete Structures are useful in studying and describing objects and problems in branches of computer science such as computer algorithms, programming languages.
2. Computer implementations are significant in applying ideas from discrete mathematics to real-world problems, such as in operations research.
3. It is a very good tool for improving reasoning and problem-solving capabilities.
4. Discrete mathematics is used to include theoretical computer science, which is relevant to computing.
5. Discrete structures in computer science with the help of process algebras.

# Course Objective

- The subject enhances one's ability to develop logical thinking and ability to problem solving.
- The objective of discrete structure is to enables students to formulate problems precisely, solve the problems, apply formal proofs techniques and explain their reasoning clearly.

# Course Outcome

Course Outcome (CO)	At the end of course , the student will be able to	Bloom's Knowledge Level (KL)
CO1	Apply the basic principles of sets, relations & functions and mathematical induction in computer science & engineering related problems	K3
CO2	Understand the algebraic structures and its properties to solve complex problems	K2
CO3	Describe lattices and its types and apply Boolean algebra to simplify digital circuit.	K2,K3
CO4	Infer the validity of statements and construct proofs using predicate logic formulas.	K3,K5
CO5	Design and use the non-linear data structure like tree and graphs to solve real world problems.	K3,K6

Engineering Graduates will be able to Understand:

1. Engineering knowledge
2. Problem analysis
3. Design/development of solutions
4. Conduct investigations of complex
5. Modern tool usage
6. The engineer and society
7. Environment and sustainability
8. Ethics
9. Individual and team work
10. Communication
11. Project management and finance
12. Life-long learning

**Subject .....**

**Time: 3 Hours**

**Max. Marks:100**

## **General Instructions:**

- All questions are compulsory. Answers should be brief and to the point.
- This Question paper consists of .....pages & ...8.....questions.
- It comprises of three Sections, A, B, and C. You are to attempt all the sections.
- **Section A** -Question No- 1 is objective type questions carrying 1 mark each, Question No- 2 is very short

# End Semester Question Paper Templates (Offline Pattern/Online Pattern)

- Section B - Question No-3 is Long answer type -I questions with external choice carrying 6 marks each.  
You need to attempt any five out of seven questions given.
- Section C - Question No. 4-8 are Long answer type -II (within unit choice) questions carrying 10 marks each. You need to attempt any one part a or b.
- Students are instructed to cross the blank sheets before handing over the answer sheet to the invigilator.
- No sheet should be left blank. Any written material after a blank sheet will not be evaluated/checked.

# Prerequisite and Recap

- Brief review of different operations like Union, Intersection, difference, Complement, Introduction of graph & concept of equivalence relation & equivalence class.

# Brief Introduction about the subject with video

**Discrete mathematics** is the study of mathematical structures that are fundamentally discrete rather than continuous. In contrast to real numbers that have the property of varying "smoothly", the objects studied in discrete mathematics – such as integers, graphs, and statements in logic.

## Youtube/other Video Links

- <https://www.youtube.com/watch?v=urd468CJCcU&list=PL0862D1A947252D20&index=36>

- Definition
- Operation
- Groups, Subgroups and order,
- Cyclic Groups, Cosets,
- Lagrange's theorem,
- Normal Subgroups, Permutation and Symmetric Groups, Group Homomorphisms,
- Rings, Internal Domains,
- Fields.

# Unit Objective

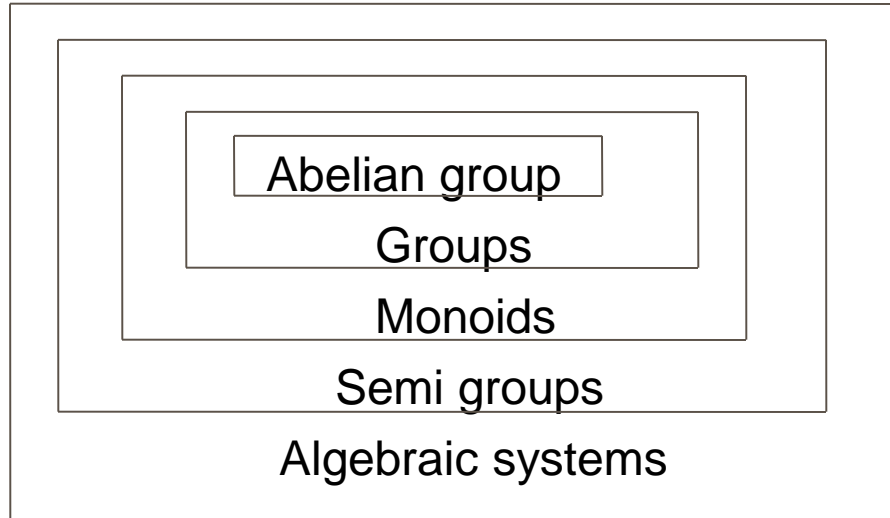

1. Algebra can help to reveal how things are built — what different scenarios have in common with each other.
2. Student will be able to understand different kind of structures.
3. Student will be able to define ring and Fields
4. Describe Homomorphism and Isomorphism structures.
5. Define Cyclic groups.

## Topic Objectives: (CO2)

### **The student will be able to:**

- Represent different Algebraic Structures.
- Give examples of Groups and Subgroups.
- Build new sets from existing sets by applying various combinations of the set operations for example intersection union, difference, and complement.
- Determine whether two sets are equal by determining whether each is a subset of the other
- Define properties of Ring and field.

# Algebraic structure(CO2)

# Algebraic Structures(CO2)

- Algebraic Structures: A non empty set  $S$  is called algebraic structure wrt binary operations  $*$ , if  $(a * b) \in S$ , for all  $a, b \in S$ .
- Here  $*$  is closure operations on  $S$
- Ex:  $(\mathbb{N}, +)$ ,
- $(\mathbb{Z}, +, -)$
- $(\mathbb{R}, +, \cdot, -)$  are algebraic structures

# Properties/ Operations(CO2)

- Commutative: Let  $*$  be a binary operation on a set  $A$ . The operation  $*$  is said to be commutative in  $A$   
if  $a * b = b * a$  for all  $a, b$  in  $A$
- Associativity: Let  $*$  be a binary operation on a set  $A$ . The operation  $*$  is said to be associative in  $A$   
if  $(a * b) * c = a * (b * c)$  for all  $a, b, c$  in  $A$
- Identity: For an algebraic system  $(A, *)$ , an element 'e' in  $A$  is said to be an identity element of  $A$   
if  $a * e = e * a = a$  for all  $a \in A$ .
- Note: For an algebraic system  $(A, *)$ , the identity element, if exists, is unique.
- Inverse: Let  $(A, *)$  be an algebraic system with identity 'e'. Let  $a$  be an element in  $A$ . An element  $b$  is said to be inverse of  $a$   
if  $a * b = b * a = e$

# Types of Algebraic structure(CO2)

## Types of Algebraic structure

There are various types of algebraic structure, which is described as follows:

- Semigroup
- Monoid
- Group
- Abelian Group

**Semi Group:** An algebraic structure  $(A, *)$  is said to be a semi group if

1.  $*$  is closed operation on  $A$ .
2.  $*$  is an associative operation, for all  $a, b, c$  in  $A$ .

Ex.  $(\mathbb{N}, +)$ ,  $(\mathbb{Z}, +)$  are semi group.

Ex.  $(\mathbb{N}, \cdot)$ ,  $(\mathbb{Z}, \cdot)$  are semi group.

Ex.  $(\mathbb{N}, -)$ ,  $(\mathbb{Z}, -)$  are not semi group.

■ **Monoid:** A monoid is a semigroup, but it contains an extra **identity element** ( $E$  or  $e$ ). An algebraic structure  $(A, *)$  is said to be a **monoid** if the following conditions are satisfied.

- 1)  $*$  is a closed operation in  $A$ .
- 2)  $*$  is an associative operation in  $A$ .
- 3) There is an identity in  $A$ .

# Algebraic structures(CO2)

## Group

A Group is a monoid, but it contains an extra **inverse element**, which is denoted by 1. An algebraic structure  $(G, *)$  will be known as a group if it satisfies the following condition:

- **Closure:**  $G$  is closed under operation  $*$  that means  $(a*b)$  belongs to set  $G$  for all  $a, b \in G$
- **Associative:**  $*$  shows an association operation between  $a, b$ , and  $c$  that means  $a*(b*c) = (a*b)*c$  for all  $a, b, c$  in  $G$ .
- **Identity Element:** There must be an identity in set  $G$  that means  $a * e = e * a = a$  for all  $a$ .
- **Inverse Element:** It contains an inverse element that means  $a * a^{-1} = a^{-1} * a = e$  for  $a \in G$

# Algebraic structures(CO2)

## Abelian Group

An abelian group is a group, but it contains **commutative law**. An algebraic structure  $(G, *)$  will be known as an abelian group if it satisfies the following condition:

- **Closure:**  $G$  is closed under operation  $*$  that means  $(a*b)$  belongs to set  $G$  for all  $a, b \in G$ .
- **Associative:**  $*$  shows an association operation between  $a, b$ , and  $c$  that means  $a*(b*c) = (a*b)*c$  for all  $a, b, c$  in  $G$ .
- **Identity Element:** There must be an identity in set  $G$  that means  $a * e = e * a = a$  for all  $a$ .
- **Inverse Element:** It contains an inverse element that means  $a * a^{-1} = a^{-1} * a = e$  for  $a \in G$ .
- **Commutative Law:** There will be a commutative law such that  $a * b = b * a$  such that  $a, b$  belongs to  $G$ .

# Monoid Example(CO2)

**Ex.** Show that the set 'N' is a monoid with respect to multiplication.

**Solution:** Here,  $N = \{1, 2, 3, 4, \dots\}$

1. Closure property : We know that product of two natural numbers is again a natural number.

i.e.,  $a.b = b.a$  for all  $a, b$  belongs to  $N$

Multiplication is a closed operation.

2. Associativity : Multiplication of natural numbers is associative.

i.e.,  $(a.b).c = a.(b.c)$  for all  $a, b, c$  belongs to  $N$

3. Identity : We have, 1 belongs to  $N$  such that

$a.1 = 1.a = a$  for all  $a$  belongs to  $N$ .

Identity element exists, and 1 is the identity element.

Hence,  $N$  is a monoid with respect to multiplication.

# Group and Abelian group(CO2)

- **Group:** An algebraic system  $(G, *)$  is said to be a **group** if the following conditions are satisfied.
  - 1)  $*$  is a closed operation.
  - 2)  $*$  is an associative operation.
  - 3) There is an identity in  $G$ .
  - 4) Every element in  $G$  has inverse in  $G$ .
  
- **Abelian group (Commutative group):** A group  $(G, *)$  is said to be *abelian* (or *commutative*) if
$$a * b = b * a \quad \forall a, b \in G.$$

# Group and Abelian group(CO2)

Example :

$(\mathbb{Z}, +)$

$(\mathbb{R}^*, .)$  GROUP

$(\mathbb{R}, .)$

$(\mathbb{N}, .)$

# Example of Abelian group(CO2)

The composition table of G is

.	1	-1	i	-i
1	1	-1	i	-i
-1	-1	1	-i	i
i	i	-i	-1	1
-i	-i	i	1	-1

**$G = \{1, -1, i, -i\}$  is an abelian group under multiplication.**

1. Closure property: Since all the entries of the composition table are the elements of the given set, the set G is closed under multiplication.
2. Associativity: The elements of G are complex numbers, and we know that multiplication of complex numbers is associative.
3. Identity: Here, 1 is the identity element and  $1 \in G$ .
4. Inverse: From the composition table, we see that the inverse elements of  
 $1, -1, i, -i$  are  $1, -1, -i, i$  respectively.
5. Commutativity: The corresponding rows and columns of the table are identical. Therefore the binary operation  $\cdot$  is commutative. Hence,  $(G, \cdot)$  is an abelian group.

# Example of Abelian group(CO2)

The composition table of G is

.	1	$\omega$	$\omega^2$
1	1	$\omega$	$\omega^2$
$\omega$	$\omega$	$\omega^2$	1
$\omega^2$	$\omega^2$	1	$\omega$

**$G = \{1, \omega, \omega^2\}$  is an abelian group under multiplication.  
Where  $1, \omega, \omega^2$  are cube roots of unity. (CO2)**

1. Closure property: Since all the entries of the composition table are the elements of the given set, the set G is closed under multiplication.
2. Associativity: The elements of G are complex numbers, and we know that multiplication of complex numbers is associative.
3. Identity: Here, 1 is the identity element and  $1 \in G$ .
4. Inverse: From the composition table, we see that the inverse elements of  $1, \omega, \omega^2$  are  $1, \omega^2, \omega$  respectively.  
Hence, G is a group w.r.t multiplication.
5. Commutativity: The corresponding rows and columns of the table are identical.  
Therefore the binary operation  $\cdot$  is commutative.

Hence, G is an abelian group w.r.t. multiplication.

## Sub-semigroup & Sub-monoid(CO2)

**Sub-semigroup** : Let  $(S, *)$  be a semigroup and let  $T$  be a subset of  $S$ . If  $T$  is closed under operation  $*$ , then  $(T, *)$  is called a subsemigroup of  $(S, *)$ .

Ex:  $(\mathbb{N}, +)$  is semigroup and  $T$  is set of even positive integers then  $(T, +)$  is a sub semigroup.

**Sub-monoid** : Let  $(S, *)$  be a monoid with identity  $e$ , and let  $T$  be a non-empty subset of  $S$ . If  $T$  is closed under the operation  $*$  and  $e \in T$ , then  $(T, *)$  is called a submonoid of  $(S, *)$ .

## Sub groups(CO2)

**Definition.** A non empty sub set  $H$  of a group  $(G, *)$  is a sub group of  $G$ , if  $(H, *)$  is a group.

Note: For any group  $\{G, *\}$ ,  $\{e, *\}$  and  $(G, *)$  are improper or trivial sub groups ,others are called proper or non trivial sub group.

Ex.  $G = \{1, -1, i, -i\}$  is a group w.r.t multiplication.

$H_1 = \{1, -1\}$  is a subgroup of  $G$ .

$H_2 = \{1\}$  is a trivial subgroup of  $G$ .

## Sub groups(CO2)

**Ex.** Let  $(Z, *)$  be an algebraic structure, where  $Z$  is the set of integers and the operation  $*$  is defined by  $n * m = \text{maximum of } (n, m)$ .

Show that  $(Z, *)$  is a semi group.

Is  $(Z, *)$  a monoid ?. Justify your answer.

**Solution:** Let  $a, b$  and  $c$  are any three integers.

Closure property: Now,  $a * b = \text{maximum of } (a, b)$  belongs to  $Z$  for all  $a, b$  belongs to  $Z$

Associativity :  $(a * b) * c = \text{maximum of } \{a, b, c\} = a * (b * c)$  belongs to  $(Z, *)$  is a semi group.

Identity : There is no integer  $x$  such that

$$a * x = \text{maximum of } (a, x) = a \quad \text{for all } a \text{ belongs to } Z$$

Identity element does not exist. Hence,  $(Z, *)$  is not a monoid.

## Daily Quiz (CO2)

1. This is an abelian group  $\{ -3n : n \in \mathbb{Z} \}$  under?  
A. division  
B. subtraction  
**C. addition**  
D. multiplication
  
2. What is the inverse of  $-1$  If  $G = \{ 1, -1, i, -i \}$  is group under multiplication?  
A.  $-1$                       **B.  $i$**                       C.  $1$                       D. None of Above
  
3. The monoid is a?  
**A. a non-abelian group**  
B. groupoid  
C. A group  
D. a commutative group

## Daily Quiz(CO2)

4.  $(ba)^{-1} = \underline{\hspace{2cm}}$  If  $a, b$  are elements of a group  $G$ ?  
A.  $b^{-1}a$       B.  $a^{-1}b$       C.  $b^{-1}a^{-1}$       **D.  $a^{-1}b^{-1}$**
5. What is an inverse of  $-i$  in the multiplicative group if  $\{1, -1, i, -i\}$  is?  
A.  $-1$       B.  $1$       **C.  $i$**       D. None of these
6. What is the value of  $(a^{-1}b)^{-1}$  is in the group  $(G, \cdot)$ ?  
**A.  $b^{-1}a$**       B.  $ab^{-1}$       C.  $ba^{-1}$       D.  $a^{-1}b$
7. What is the inverse of an if  $(\mathbb{Z}, *)$  is a group with  $a*b = a+b+1 \forall a, b \in \mathbb{Z}$ ?  
A.  $-2$       B.  $0$       **C.  $-a-2$**       D.  $a-2$

# Daily Quiz(CO2)

8. An algebraic structure \_\_\_\_\_ is called a semigroup.

- a)  $(P, *)$
- b)  $(Q, +, *)$
- c)  $(P, +)$
- d)  $(+, *)$

9. Condition for monoid is \_\_\_\_\_

- a)  $(a+e)=a$
- b)  $(a*e)=(a+e)$
- c)  $a=(a*(a+e))$
- d)  **$(a*e)=(e*a)=a$**

10. A monoid is called a group if \_\_\_\_\_

- a)  $(a*a)=a=(a+c)$
- b)  $(a*c)=(a+c)$
- c)  $(a+c)=a$
- d)  **$(a*c)=(c*a)=e$**

11. What is the inverse of an if  $(Z, *)$  is a group with  $a*b = a+b+1 \forall a, b \in Z$ ?

- A. -2
- B. 0
- C. **-a-2**
- D. a-2

# Daily Quiz(CO2)

12. A group  $(M, *)$  is said to be abelian if \_\_\_\_\_

a)  $(x+y)=(y+x)$

**b)  $(x*y)=(y*x)$**

c)  $(x+y)=x$

d)  $(y*x)=(x+y)$

13. Condition for monoid is \_\_\_\_\_

a)  $(a+e)=a$

b)  $(a*e)=(a+e)$

c)  $a=(a*(a+e))$

**d)  $(a*e)=(e*a)=a$**

14. How many properties can be held by a group?

a) 2

b) 3

**c) 5**

d) 4

15. A cyclic group is always \_\_\_\_\_
- a) **abelian group**
  - b) monoid
  - c) semigroup
  - d) subgroup
16.  $\{1, i, -i, -1\}$  is \_\_\_\_\_
- a) semigroup
  - b) subgroup
  - c) **cyclic group**
  - d) abelian group
17. A subgroup has the properties of \_\_\_\_\_
- a) Closure, associative
  - b) Commutative, associative, closure
  - c) Inverse, identity, associative
  - d) **Closure, associative, Identity, Inverse**

18. Which sentence is true?

- A. Set of all matrices forms a group under multiplication
- B. Set of all rational negative numbers forms a group under multiplication
- C. Set of all non-singular matrices forms a group under multiplication**
- D. Both (b) and (c)

19. Which statement is false?

- A. The set of rational integers is an abelian group under addition
- B. The set of rational numbers form an abelian group under multiplication**
- C. The set of rational numbers is an abelian group under addition
- D. None of these

20. What is the identity element In the group  $G = \{2, 4, 6, 8\}$  under multiplication modulo 10?

- A. 5
- B. 9
- C. 6**
- D. 12

## Theorem 1(CO2)

**Theorem:** If every element of a group is its own inverse, then show that the group must be abelian .

**Proof:** Let  $(G, *)$  be a group.

Let  $a$  and  $b$  are any two elements of  $G$ .

Consider the identity,

$$(a * b)^{-1} = b^{-1} * a^{-1}$$

$$\Rightarrow (a * b) = b * a \quad (\text{Since each element of } G \text{ is its own inverse})$$

Hence,  $G$  is abelian.

## Theorem 2 (CO2)

**Theorem: A necessary and sufficient condition for a non empty subset H of a group  $(G, *)$  to be a sub group is that**

$$a \in H, b \in H \Rightarrow a * b^{-1} \in H.$$

**Proof:**

Case1: Let  $(G, *)$  be a group and H is a subgroup of G

Let  $a, b \in H \Rightarrow b^{-1} \in H$  ( since H is is a group)

$\Rightarrow a * b^{-1} \in H.$  ( By closure property in H)

Case2: Let H be a non empty set of a group  $(G, *)$ .

Let  $a * b^{-1} \in H \quad \forall a, b \in H$

Now,  $a * a^{-1} \in H$  ( Taking  $b = a$  )

$\Rightarrow e \in H$  i.e., identity exists in H.

Now,  $e \in H, a \in H \Rightarrow e * a^{-1} \in H$

$\Rightarrow a^{-1} \in H$

$\therefore$  Each element of  $H$  has inverse in  $H$ .

Further,  $a \in H, b \in H \Rightarrow a \in H, b^{-1} \in H$

$\Rightarrow a * (b^{-1})^{-1} \in H.$

$\Rightarrow a * b \in H.$

$\therefore H$  is closed w.r.t  $*$ .

Finally, Let  $a, b, c \in H$

$\Rightarrow a, b, c \in G$  ( since  $H \subseteq G$  )

$\Rightarrow (a * b) * c = a * (b * c)$

$\therefore *$  is associative in  $H$

Hence,  $H$  is a subgroup of  $G$ .

## Theorem 3(CO2)

**Theorem :** In a group  $(G, *)$ , if  $(a * b)^2 = a^2 * b^2 \quad \forall a, b \in G$  then show that  $G$  is abelian group.

**Proof:** Given that  $(a * b)^2 = a^2 * b^2$

$$\Rightarrow (a * b) * (a * b) = (a * a) * (b * b)$$

$$\Rightarrow a * (b * a) * b = a * (a * b) * b \quad (\text{By associative law})$$

$$\Rightarrow (b * a) * b = (a * b) * b \quad (\text{By left cancellation law})$$

$$\Rightarrow (b * a) = (a * b) \quad (\text{By right cancellation law})$$

Hence,  $G$  is abelian group.

**Note:**  $a^2 = a * a$

$a^3 = a * a * a$  etc.

# Modulo systems(CO2)

## Addition modulo m ( $+_m$ )

let  $m$  is a positive integer. For any two positive integers  $a$  and  $b$

$$a +_m b = a + b \quad \text{if } a + b < m$$

$$a +_m b = r \quad \text{if } a + b \geq m \quad \text{where } r \text{ is the remainder obtained by dividing } (a+b) \text{ with } m.$$

## Multiplication modulo p ( $\times_p$ )

let  $p$  is a positive integer. For any two positive integers  $a$  and  $b$

$$a \times_p b = a b \quad \text{if } a b < p$$

$$a \times_p b = r \quad \text{if } a b \geq p \quad \text{where } r \text{ is the remainder obtained by dividing } (ab) \text{ with } p.$$

$$\text{Ex. } 3 \times_5 4 = 2 \quad , \quad 5 \times_5 4 = 0 \quad , \quad 2 \times_5 2 = 4$$

# Addition Modulo ( $+_m$ ) (CO2)

**The set  $G = \{0,1,2,3,4,5\}$  is a group with respect to addition modulo 6.**

The composition table of  $G$  is

$+_6$	0	1	2	3	4	5
0	0	1	2	3	4	5
1	1	2	3	4	5	0
2	2	3	4	5	0	1
3	3	4	5	0	1	2
4	4	5	0	1	2	3
5	5	0	1	2	3	4

1. Closure property: Since all the entries of the composition table are the elements of the given set, the set  $G$  is closed under  $+_6$ .

2. Associativity: The binary operation  $+_6$  is associative in  $G$ .

for ex.  $(2 +_6 3) +_6 4 = 5 +_6 4 = 3$  and

$$2 +_6 (3 +_6 4) = 2 +_6 1 = 3$$

3. Identity: Here, The first row of the table coincides with the top row. The element heading that row, i.e., 0 is the identity element.

4. Inverse: From the composition table, we see that the inverse elements of 0, 1, 2, 3, 4, 5 are 0, 5, 4, 3, 2, 1 respectively.

5. Commutativity: The corresponding rows and columns of the table are identical. Therefore the binary operation  $+_6$  is commutative.

Hence,  $(G, +_6)$  is an abelian group.

# Multiplication Modulo ( $\times_m$ ) (CO2)

**The set  $G = \{1,2,3,4,5,6\}$  is a group with respect to multiplication modulo 7.**

The composition table of  $G$  is

$\times_7$	1	2	3	4	5	6
1	1	2	3	4	5	6
2	2	4	6	1	3	5
3	3	6	2	5	1	4
4	4	1	5	2	6	3
5	5	3	1	6	4	2
6	6	5	4	3	2	1

1. Closure property: Since all the entries of the composition table are the elements of the given set, the set  $G$  is closed under  $\times_7$ .

2. Associativity: The binary operation  $\times_7$  is associative in G.

$$\text{for ex. } (2 \times_7 3) \times_7 4 = 6 \times_7 4 = 3 \quad \text{and}$$

$$2 \times_7 (3 \times_7 4) = 2 \times_7 5 = 3$$

3. Identity: Here, The first row of the table coincides with the top row. The element heading that row, i.e., 1 is the identity element.

4. Inverse: From the composition table, we see that the inverse elements of 1, 2, 3, 4, 5, 6 are 1, 4, 5, 2, 5, 6 respectively.

5. Commutativity: The corresponding rows and columns of the table are identical. Therefore the binary operation  $\times_7$  is commutative.

Hence,  $(G, \times_7)$  is an abelian group.

- **Order of an element of a group:**

Let  $(G, *)$  be a group. Let 'a' be an element of  $G$ . The smallest integer  $n$  such that  $a^n = e$  is called order of 'a'. If no such number exists then the order is infinite.

- **Order of group:**

The number of elements in a group is called order of group.

- **Cyclic group:**

Cyclic groups are groups in which every element is a power of some fixed element. A group  $G$  is called cyclic if for some element  $a$  belongs to  $G$ , every element is of the form  $a^n$  where  $n$  is some integer.

$$G = \{a^n : n \text{ belongs to } \mathbb{Z}\}$$

The element  $a$  is called a generator.

# Homomorphism and Isomorphism(CO2)

**Homomorphism** : Consider the groups  $(G, *)$  and  $(G^1, \oplus)$

A function  $f : G \rightarrow G^1$  is called a homomorphism if

$$f(a * b) = f(a) \oplus f(b)$$

**Isomorphism** : If a homomorphism  $f : G \rightarrow G^1$  is a bijection then  $f$  is called isomorphism between  $G$  and  $G^1$ .

Then we write  $G \cong G^1$

## Example of Homomorphic group(CO2)

**Ex.** Let  $R$  be a group of all real numbers under addition and  $R^+$  be a group of all positive real numbers under multiplication. Show that the mapping  $f : R^+ \rightarrow R$  defined by  $f(x) = \log_{10} x$  for all  $x \in R^+$  is an isomorphism.

**Solution:** First, let us show that  $f$  is a homomorphism.

Let  $a, b \in R^+$ .

$$\begin{aligned}\text{Now, } f(a.b) &= \log_{10} (a.b) \\ &= \log_{10} a + \log_{10} b \\ &= f(a) + f(b)\end{aligned}$$

$\therefore f$  is an homomorphism.

Next, let us prove that  $f$  is a Bijection.

For any  $a, b \in \mathbb{R}^+$ , Let,  $f(a) = f(b)$

$$\Rightarrow \log_{10} a = \log_{10} b$$

$$\Rightarrow a = b$$

$\therefore f$  is one.to-one.

Next, take any  $c \in \mathbb{R}$ .

Then  $10^c \in \mathbb{R}^+$  and  $f(10^c) = \log_{10} 10^c = c$ .

$\Rightarrow$  Every element in  $\mathbb{R}$  has a pre image in  $\mathbb{R}^+$ .

i.e.,  $f$  is onto.

$\therefore f$  is a bijection.

Hence,  $f$  is an isomorphism.

# Theorem for Homomorphism(CO2)

**Theorem:** Consider the groups  $(G_1, *)$  and  $(G_2, \oplus)$  with identity elements  $e_1$  and  $e_2$  respectively. If  $f : G_1 \rightarrow G_2$  is a group homomorphism, then prove that

a)  $f(e_1) = e_2$

b)  $f(a^{-1}) = [f(a)]^{-1}$

c) If  $H_1$  is a sub group of  $G_1$  and  $H_2 = f(H_1)$ ,  
then  $H_2$  is a sub group of  $G_2$ .

d) If  $f$  is an isomorphism from  $G_1$  onto  $G_2$ ,  
then  $f^{-1}$  is an isomorphism from  $G_2$  onto  $G_1$ .

- a) we have in  $G_2$ ,

$$\begin{aligned}
 e_2 \oplus f(e_1) &= f(e_1) && \text{( since, } e_2 \text{ is identity in } G_2 \text{)} \\
 &= f(e_1 * e_1) && \text{( since, } e_1 \text{ is identity in } G_1 \text{)} \\
 &= f(e_1) \oplus f(e_1) && \text{( since } f \text{ is a homomorphism)} \\
 e_2 &= f(e_1) && \text{( By right cancellation law )}
 \end{aligned}$$

- b) For any  $a \in G_1$ , we have

$$\begin{aligned}
 f(a) \oplus f(a^{-1}) &= f(a * a^{-1}) = f(e_1) = e_2 \\
 \text{and } f(a^{-1}) \oplus f(a) &= f(a^{-1} * a) = f(e_1) = e_2 \\
 \therefore f(a^{-1}) &\text{ is the inverse of } f(a) \text{ in } G_2 \\
 \text{i.e., } [f(a)]^{-1} &= f(a^{-1})
 \end{aligned}$$

- c)  $H_2 = f(H_1)$  is the image of  $H_1$  under  $f$ ; this is a subset of  $G_2$ .

Let  $x, y \in H_2$ .

Then  $x = f(a)$ ,  $y = f(b)$  for some  $a, b \in H_1$

Since,  $H_1$  is a subgroup of  $G_1$ , we have  $a * b^{-1} \in H_1$ .

Consequently,

$$\begin{aligned} x \oplus y^{-1} &= f(a) \oplus [f(b)]^{-1} \\ &= f(a) \oplus f(b^{-1}) \\ &= f(a * b^{-1}) \in f(H_1) = H_2 \end{aligned}$$

Hence,  $H_2$  is a subgroup of  $G_2$ .

- d) Since  $f : G_1 \rightarrow G_2$  is an isomorphism,  $f$  is a bijection.

$\therefore f^{-1} : G_2 \rightarrow G_1$  exists and is a bijection.

Let  $x, y \in G_2$ . Then  $x \oplus y \in G_2$

and there exists  $a, b \in G_1$  such that  $x = f(a)$  and  $y = f(b)$ .

$$\begin{aligned}\therefore f^{-1}(x \oplus y) &= f^{-1}(f(a) \oplus f(b)) \\ &= f^{-1}(f(a * b)) \\ &= a * b \\ &= f^{-1}(x) * f^{-1}(y)\end{aligned}$$

This shows that  $f^{-1} : G_2 \rightarrow G_1$  is an homomorphism as well.

$\therefore f^{-1}$  is an isomorphism.

# Cosets(CO2)

If  $H$  is a sub group of  $(G, *)$  and  $a \in G$  then the set

$Ha = \{ h * a \mid h \in H \}$  is called a right coset of  $H$  in  $G$ .

Similarly,  $aH = \{ a * h \mid h \in H \}$  is called a left coset of  $H$  in  $G$ .

**Note:-** 1) Any two left (right) cosets of  $H$  in  $G$  are either identical or disjoint.

2) Let  $H$  be a sub group of  $G$ . Then the right cosets of  $H$  form a partition of  $G$ . i.e., the union of all right cosets of a sub group  $H$  is equal to  $G$ .

3) **Lagrange's theorem**: The order of each sub group of a finite group is a divisor of the order of the group.

4) The order of every element of a finite group is a divisor of the order of the group.

5) The converse of the lagrange's theorem need not be true.

# State and prove Lagrange's Theorem(CO2)

**Lagrange's theorem:** The order of each sub group  $H$  of a finite group  $G$  is a divisor of the order of the group.

**Proof:** Since  $G$  is finite group,  $H$  is finite.

Therefore, the number of cosets of  $H$  in  $G$  is finite.

Let  $Ha_1, Ha_2, \dots, Ha_r$  be the distinct right cosets of  $H$  in  $G$ .

Then,  $G = Ha_1 \cup Ha_2 \cup \dots \cup Ha_r$

So that  $O(G) = O(Ha_1) + O(Ha_2) + \dots + O(Ha_r)$ .

But,  $O(Ha_1) = O(Ha_2) = \dots = O(Ha_r) = O(H)$

$\therefore O(G) = O(H) + O(H) + \dots + O(H)$ . ( $r$  terms)

$$= r \cdot O(H)$$

This shows that  $O(H)$  divides  $O(G)$ .

# Ring(CO2)

Let  $\langle R, +, . \rangle$  be an algebraic structure for a nonempty set  $R$  and two binary operations  $+$  and  $.$  defined on it.

An algebraic structure  $(R, +, .)$  is called ring if the following conditions are satisfied.

- $(R, +)$  is an abelian group
- $(R, .)$  is a semigroup
- The operation  $.$  is *distributive* over the operation  $+$  in  $R$ .  
$$a . (b + c) = (a . b) + (a . c)$$
$$(a + b) . c = (a . c) + (b . c) \text{ for all } a, b, c \in R.$$
- The operation  $+$  is *commutative* and *associative*.  
$$a + b = b + a, \text{ for all } a, b \in R.$$
$$a + (b + c) = (a + b) + c, \text{ for all } a, b, c \in R.$$
- There exists the *identity element*  $0$  in  $R$  w.r.t.  $+$ .  
$$a + 0 = 0 + a = a, \text{ for every } a \in R.$$
- Every element in  $R$  is *invertible* w.r.t.  $+$ .  
With every  $a \in R$  there exists in  $R$  its inverse element, denoted by  $(-a)$ .  
$$a + (-a) = (-a) + a = 0.$$

# Ring(CO2)

- The operation  $\cdot$  is associative  
$$a \cdot (b \cdot c) = (a \cdot b) \cdot c \text{ for all } a, b, c \in R.$$
- The operation  $\cdot$  is *distributive* over the operation  $+$  in  $R$ .  
$$a \cdot (b + c) = (a \cdot b) + (a \cdot c)$$
$$(a + b) \cdot c = (a \cdot c) + (b \cdot c) \text{ for all } a, b, c \in R.$$

## Types of Rings

### 1. Null Ring

The singleton  $\{0\}$  with binary operation  $+$  and defined by  $0 + 0 = 0$  and  $0 \cdot 0 = 0$  is a ring called the zero ring or null ring.

### 2. Commutative Ring

If the multiplication in a ring is also commutative then the ring is known as commutative ring i.e. the ring  $(R, +, \cdot)$  is a commutative ring provided.

**$a \cdot b = b \cdot a$  for all  $a, b \in R$**

If the multiplication is not commutative it is called non-commutative ring.

### 3. Ring with unity

If  $e$  be an element of a ring  $R$  such that  $e \cdot a = a \cdot e = a$  for all  $a \in R$  then the ring is called ring with unity and the elements  $e$  is said to be units elements or unity or identity of  $R$

## 4. Ring with zero divisor

A ring  $(R, +, \cdot)$  is said to have divisor of zero (or zero divisor), if there exist two non-zero elements  $a, b \in R$  such that  $a \cdot b = 0$  or  $b \cdot a = 0$  where  $0$  is the additive identity in  $R$ . here  $a$  and  $b$  are called the proper divisor of zero.

## 5. Ring without zero divisor

A ring  $R$  is said to be without zero divisor. If the product of no two non zero elements of  $R$  is zero i.e. if  $ab = 0 \Rightarrow a = 0$  or  $b = 0$ .

## Zero ring(CO2)

The zero ring is the unique ring in which the additive identity 0 and multiplicative identity 1 coincide

- The zero ring is commutative.
- The element 0 in the zero ring is a unit, serving as its own multiplicative inverse.
- The unit group of the zero ring is the trivial group  $\{0\}$ .
- The element 0 in the zero ring is not a zero divisor.

# Ring with Unity(CO2)

If in a ring there exist an element denoted by 1 such that  
 $1.a=a.1$  for all  $a \in R$  then  $R$  is called Ring with unity element

## *Examples*

1.  $\langle \mathbb{Z}, +, \cdot \rangle$ ,  $\mathbb{Z}$  is a set of integers and binary operations  $+$  and  $\cdot$ .
2.  $\langle \mathbb{Q}, +, \cdot \rangle$ ,  $\mathbb{Q}$  is a set of rational nos. and binary operations  $+$  and  $\cdot$ .
3.  $\langle \mathbb{R}, +, \cdot \rangle$ ,  $\mathbb{R}$  is a set of real nos. and binary operations  $+$  and  $\cdot$ .

# Commutative Ring(CO2)

If the operation  $\cdot$  is *commutative* in a ring  $\langle R, +, \cdot \rangle$ .

## *Examples*

1.  $\langle \mathbb{Z}, +, \cdot \rangle$ ,  $\mathbb{Z}$  is a set of integers and binary operations  $+$  and  $\cdot$ .
2.  $\langle \mathbb{Q}, +, \cdot \rangle$ ,  $\mathbb{Q}$  is a set of rational nos. and binary operations  $+$  and  $\cdot$ .
3.  $\langle \mathbb{R}, +, \cdot \rangle$ ,  $\mathbb{R}$  is a set of real nos. and binary operations  $+$  and  $\cdot$ .

# Ring without Unity(CO2)

A ring  $R$  which does not contain multiplicative identity is called a ring without unity.

Example

$$A = \{ \dots -6, -4, -2, 0, 2, 4, 6, \dots \}$$

## Finite and Infinite ring:

If number of elements in the ring  $R$  is finite then  $(R, +, \cdot)$  is called finite ring otherwise it is called an infinite ring.

**Order of ring :** The number of elements in a finite ring  $R$  is called order of ring  $R$ . It is denoted by  $O(R)$

**Invertible ring :** Let  $(R, +, \cdot)$  be ring with unity, an element  $a \in R$  is said to be invertible, if there exist an element  $b$  is called the inverse of  $a$  such that

$$a \cdot b = b \cdot a = 1$$

# Ring with Zero divisor(CO2)

## Ring with zero divisor:

If the product of non zero elements of  $R$  is zero.

$a.b = 0 \Rightarrow a$  and  $b$  are not zero

$R = \{0, 1, 2, 3, 4, 5\}$

$(R, +_6, \times_6)$

## Ring without zero divisor:

$a.b = 0 \Rightarrow a=0$  or  $b=0$

$(Z, +, \times)$

# Example of Rings(CO2)

1) Let  $S = \{0, 1\}$  and the operations  $+$  and  $.$  on  $s$  be defined by the following tables:

$+$	0	1
0	0	1
1	1	0

$.$	0	1
0	0	0
1	0	1

Show that  $\langle S, +, . \rangle$  is a *commutative ring with unity*.

# Example of Rings(CO2)

2) Let  $S = \{a, b, c, d\}$  and the operations  $+$  and  $.$  on  $s$  be defined by the following tables:

+	a	b	c	d
a	a	b	c	d
b	b	a	d	c
c	c	d	b	a
d	d	c	a	b

.	a	b	c	d
a	a	a	a	a
b	a	a	b	a
c	a	b	c	d
d	a	a	d	a

Show that  $\langle S, +, . \rangle$  is a *ring*.

A **field** is a set with the two binary operations of addition and multiplication, both of which operations are :

1. commutative
2. associative
3. contain identity elements
4. contain inverse elements.

The identity element for addition is 0, and the identity element for multiplication is 1. Given  $x$ , the inverse element for addition is  $-x$ , and the multiplicative inverse element for multiplication is  $1/x$  ( $x \neq 0$ ). Furthermore, multiplication distributes over addition.

**One example is the field of rational numbers  $\mathbb{Q}$** , that is all numbers  $q$  such that for integers  $a$  and  $b$ ,  $q=a/b$  where  $b \neq 0$ . The definition of a field applies to this number set. We also note that the set of real numbers  $\mathbb{R}$  is also a field (see Example 1). Since  $\mathbb{Q} \subset \mathbb{R}$  (the rational numbers are a subset of the real numbers), we can say that  $\mathbb{Q}$  is a *subfield* of  $\mathbb{R}$ . Alternatively we can say that  $\mathbb{R}$  is an *extension* of  $\mathbb{Q}$ .

# Daily Quiz (CO2)

1. In a group there must be only \_\_\_\_\_ element.  
a) 1  
b) 2  
c) 3  
d) 5
2. \_\_\_\_\_ is the multiplicative identity of natural numbers.  
a) 0  
b) -1  
c) 1  
d) 2
3. The set of even natural numbers,  $\{6, 8, 10, 12, \dots\}$  is closed under addition operation. Which of the following properties will it satisfy?  
a) **closure property**  
b) associative property  
c) symmetric property  
d) identity property
4. If  $(M, *)$  is a cyclic group of order 73, then number of generator of  $G$  is equal to \_\_\_\_\_.  
a) 89    b) 23    **c) 72**    d) 17

## Daily Quiz (CO2)

5. A group  $G, (\{0\}, +)$  under addition operation satisfies which of the following properties?

- a) identity, multiplicity and inverse
- b) closure, associativity, inverse and identity**
- c) multiplicity, associativity and closure
- d) inverse and closure

6. Let  $G$  be a finite group with two sub groups  $M$  &  $N$  such that  $|M|=56$  and  $|N|=123$ . Determine the value of  $|M \cap N|$ .

- a) 1**
- b) 56
- c) 14
- d) 78

7. Let  $*$  be the binary operation on the rational number given by  $a*b=a+b+ab$ . Which of the following property does not exist for the group?

- a) closure property
- b) identity property**
- c) symmetric property
- d) associative property

# Weekly Assignment

1. Let  $(G, *)$  be a group, where  $*$  is usual multiplication operation on  $G$ . Then show that for any  $x, y \in G$  following equations holds:  $(x^{-1})^{-1} = x$        $(xy)^{-1} = y^{-1}x^{-1}$
2. Define rings and write its properties.
3. Write the properties of Group. Show that the set  $(1,2,3,4,5)$  is not group under addition and multiplication modulo 6.
4. Define rings and fields
5. Show that  $(R - \{1\}, *)$  where the operation is defined as  $a*b = a + b - ab$  is an abelian group.
6. Let  $G = (\mathbb{Z}^2, +)$  be a group and let  $H$  be a subgroup of  $G$  where  $H = \{(x, y) \mid x = y\}$ . Find the left cosets of  $H$  in  $G$ . Here  $\mathbb{Z}$  is the set of integers
7. Let  $u_8 = \{1, 3, 5, 7\}$  be a group with binary operation multiplication modulo 8. Find all proper subgroups of  $u_8$ .
8. Prove that  $(R, +, *)$  is a ring with zero divisors, where  $R$  is  $2 \times 2$  matrix and  $+$  and  $*$  are usual addition and multiplication operations.

1. Consider the binary operations on  $X$ ,  $a*b = a+b+4$ , for  $a, b \in X$ . It satisfies the properties of \_\_\_\_\_
- a) **abelian group**
  - b) semigroup
  - c) multiplicative group
  - d) isomorphic group
2. If  $x * y = x + y + xy$  then  $(G, *)$  is \_\_\_\_\_
- a) Monoid
  - b) Abelian group
  - c) **Commutative semigroup**
  - d) Cyclic group
3. A function defined by  $f(x)=2*x$  such that  $f(x+y)=2x+y$  under the group of real numbers, then \_\_\_\_\_
- a) Isomorphism exists
  - b) **Homomorphism exists**
  - c) Heteromorphic exists
  - d) Association exists

4. A function  $f:(M,*)\rightarrow(N,\times)$  is a homomorphism if \_\_\_\_\_

a)  $f(a, b) = a*b$

**b)  $f(a, b) = a/b$**

c)  $f(a, b) = f(a)+f(b)$

d)  $f(a, b) = f(a)*f(a)$

5. Condition of semigroup homomorphism should be \_\_\_\_\_

a)  $f(x * x) = f(x * y)$

b)  $f(x) = f(y)$

c)  $f(x) * f(y) = f(y)$

**d)  $f(x * y) = f(x) * f(y)$**

6. The set of rational numbers form an abelian group under \_\_\_\_\_

a) Association

b) Closure

**c) Multiplication**

d) Addition

7. If  $F$  is a free semigroup on a set  $S$ , then the concatenation of two even words is \_\_\_\_\_
- a) a semigroup of  $F$
  - b) a subgroup of  $F$**
  - c) monoid of  $F$
  - d) cyclic group of  $F$
8. The set of odd and even positive integers closed under multiplication is \_\_\_\_\_
- a) a free semigroup of  $(M, \times)$
  - b) a subsemigroup of  $(M, \times)$**
  - c) a semigroup of  $(M, \times)$
  - d) a subgroup of  $(M, \times)$
9. If  $a * b = a$  such that  $a * (b * c) = a * b = a$  and  $(a * b) * c = a * b = a$  then \_\_\_\_\_
- a)  $*$  is associative**
  - b)  $*$  is commutative
  - c)  $*$  is closure
  - d)  $*$  is abelian

# GLOSSARY QUESTION (CO1)

1. An algebraic structure called a semigroup
2. Condition for monoid is
3. A monoid is called a group
4. Matrix multiplication is an property
5. How many properties can be held by a group

1. 5
2.  $(a*c) = (c*a) = e$
3.  $(a*c) = (c*a) = e$
4. Associative
5.  $(P,*)$

1. A cyclic group is always
2.  $\{1, i, -i, -1\}$  is
3. A subgroup has the properties of
4. The set of rational numbers form an abelian group under

1. 4
2. Abelian group
3. Multiplication
4. cyclic group

# GLOSSARY QUESTION (CO1)

1. A function  $f:(M,*)\rightarrow(N,x)$  is homomorphism
2. If  $x * y = x + y + xy$  then  $(G, *)$  is
3. In a group there must be one element.
4. 1 is the multiplicative identity of natural numbers.
5. An identity element of a group has element.

1. 1
2. Inverse
3. Commutative Semigroup
4. 1
5.  $a * b = f(a) \cdot F(b)$

# Old Question Papers

1. Define rings and write its properties.
2. Write the properties of Group. Show that the set  $\{1,2,3,4,5\}$  is not group under addition and multiplication modulo 6.
3. Define rings and fields.
4. Show that  $(R - \{1\}, *)$  where the operation is defined as  $a*b = a + b - ab$  is an abelian group.
5. Let  $G = (Z^2, +)$  be a group and let  $H$  be a subgroup of  $G$  where  $H = \{(x, y) \mid x = y\}$ . Find the left cosets of  $H$  in  $G$ . Here  $Z$  is the set of integers
6. Let  $(G, *)$  be a group, where  $*$  is usual multiplication operation on  $G$ . Then show that for any  $x, y \in G$  following equations holds:  $(x^{-1})^{-1} = x$  and  $(xy)^{-1} = y^{-1}x^{-1}$
7. Let  $u_8 = \{1, 3, 5, 7\}$  be a group with binary operation multiplication modulo 8. Find all proper subgroups of  $u_8$ .
8. Prove that  $(R, +, *)$  is a ring with zero divisors, where  $R$  is  $2 \times 2$  matrix and  $+$  and  $*$  are usual addition and multiplication operations.

# Expected Questions for University Exam

1. Write the properties of Group. Show that the set  $(1,2,3,4,5)$  is not group under addition and multiplication modulo 6.
2. Define rings and fields.
3. Show that  $(R - \{1\}, *)$  where the operation is defined as  $a*b = a + b - ab$  is an abelian group.
4. Let  $G = (Z^2, +)$  be a group and let  $H$  be a subgroup of  $G$  where  $H = \{(x, y) \mid x = y\}$ . Find the left cosets of  $H$  in  $G$ . Here  $Z$  is the set of integers.
5. Show that every cyclic group is abelian.
6. Show that  $G = \{1, -1, i, -i\}$  is an abelian group under multiplication.
7. If every element of a group is its own inverse, then show that the group must be abelian.
8. Show that  $G = \{1, \omega, \omega^2\}$  is an abelian group under multiplication. Where  $1, \omega, \omega^2$  are cube roots of unity.
9. If  $A$  has 4 elements  $B$  has 8 then find minimum and maximum elements in  $A \cup B$ .
10. Prove that  $(R, +, *)$  is a ring with zero divisors, where  $R$  is  $2 \times 2$  matrix and  $+$  and  $*$  are usual addition and multiplication operations.

# RECAP OF UNIT (CO2)

- **Algebraic Structure**

- A non empty set  $S$  is called an algebraic structure w.r.t binary operation  $(*)$  if it follows following axioms:**Closure:** $(a*b)$  belongs to  $S$  for all  $a,b \in S$ .

- **Semigroup**

- A finite or infinite set ' $S$ ' with a binary operation ' $\circ$ ' (Composition) is called semigroup if it holds following two conditions simultaneously –
- **Closure** – For every pair  $(a,b) \in S, (a \circ b) \in S$ ,  $(a \circ b)$  has to be present in the set  $S$ .
- **Associative** – For every element  $a,b,c \in S, (a \circ b) \circ c = a \circ (b \circ c)$
- **Monoid**
- A monoid is a semigroup with an identity element. The identity element (denoted by  $e$  or  $E$ ) of a set  $S$  is an element such that  $(a \circ e) = a$ , for every element  $a \in S$ . An identity element is also called a **unit element**. So, a monoid holds three properties simultaneously – **Closure, Associative, Identity element**

# RECAP OF UNIT (CO2)

- **Group**

- A group is a monoid with an inverse element. The inverse element (denoted by  $I$ ) of a set  $S$  is an element such that  $(aI)=(Ia)=a(aI)=(Ia)=a$ , for each element  $a \in S$ . So, a group holds four properties simultaneously - i) Closure, ii) Associative, iii) Identity element, iv) Inverse element.

- **Abelian Group**

- An abelian group  $G$  is a group for which the element pair  $(a,b) \in G$  always holds commutative law. So, a group holds five properties simultaneously - i) Closure, ii) Associative, iii) Identity element, iv) Inverse element, v) Commutative.

- **Cyclic Group and Subgroup**

- A **cyclic group** is a group that can be generated by a single element. Every element of a cyclic group is a power of some specific element which is called a generator
